ACKNOWLEDGEMENTS

First and foremost, I must express my deepest gratitude to Professor C. Lewis Cocke. Any words I can conjure will fall far short of an adequate description of his influence on my life. I am to this day constantly amazed at his ability to simultaneously be an invaluable presence and resource in every aspect of my development as a scientist and teacher, while at the same time pushing me to be a self-critical and independent human being. Lew is a consummate example of a scientist and educator. He is the role model that I will endeavor to emulate throughout the whole of my career. Thanks Lew, for everything.

Many thanks go to members of my committee, particularly Professors Martin Stockli and Patrick Richard. Pat has been a source of advice and wisdom for me over the past decade and Martin has shown me how a good sense of humor can enhance the joy of one's work. Thanks as well to the Dr. Muenzenberger for showing a genuine interest in and taking the time to learn about my work. I would also like to acknowledge Dr. Klabunde for serving as my committee chair.

I would also like to thank the other faculty, for whose advice and friendship I have always been grateful. Particularly Professors Brett DePaola and Itzhak Ben-Itzhak, as well as Professor Siegbert Hagmann.

Dr. Kevin Carnes has been a precious resource for a variety of reasons. Without his computer expertise to his help with complex accelerator operations, this work could not and would not have been completed. Kevin has always been an important source of advice to me, both personally and professionally.

There is not sufficient room to fully express my appreciation to Mahendrajit Singh for his endurance during the long beamtime hours and for his patience with my moods. His comforting presence during many frustrating moments was very important to me.

Thanks to the laboratory staff for all of their help and friendship. Particularly Mike Wells, who was always ready with solutions to a myriad of problems. I would also like to thank Al Rankin, Bob Krause, Tracy Tipping, and Vince Needham.

Many thanks to my colleague and friend Eric Wells for too many things to list here (including the editing of this dissertation).

Thanks to REU students Christian Dilley and Gabe Moore who worked with me during the summers.

I must give thanks to one of the best teachers I have had honor to know. At an early stage, Roger Diekmann infused in me the realization that science is everywhere in the world around us and that it is something to be excited about. It is in large part due to his influence that I am pursuing a career in scientific research and education.

Thanks to my parents for not only telling me I could accomplish anything I wanted to, but that I should.

Most of all, I must thank my wife Denise for all of the love, support, and patience she has given me over the past years.

In memory of

John P. Giese.
